Password Reset application internationalization - SSO

The user interface and email internalization texts are defined in resources_*xx*.properties files, located in the ubilogin/custom/password-reset –folder (where *xx* represents a locale defined in the SSO UI template, e.g. ubilogin/custom/password-reset/resources_en.properties for English). Initially this folder is empty, and properties files for required locales should be created as part of installation process. A template properties file for English is available for reference as described below.

The set of supported locales is defined in the SSO Server application UI template and the language selection links are generated using client-side JavaScript. If a resource_xx.properties file for some locale can't be found, or a specific key of a specific language is missing, then the Password Reset application will fall back to looking up the key in the resources.properties file, (i.e. without an ISO-639-1 language identifier in the filename.)

> ⚠ Note that the SMS and email messages sent by the Password Reset are localized in these resource properties by using parameters *otp.sms-mt-otp.message.body* for the SMS and *otp.smtp-otp.message.title* and *otp.smtp-otp.message.body* for the email. The respective parameters in SSO UI messages are not used with Password Reset application.

Messages

Below is the default message resources for English locale. Most up-to-date version of it can be found in ubilogin/custom_templates/password-reset /resources_en.properties, and can be copied as is under the ubilogin/custom/password-reset. Please note that if new message parameters are introduced in future versions, the ubilogin/custom_templates/password-reset/resources_xx.properties will get updated accordingly, but the corresponding files in ubilogin/custom/password-reset/ will need to be manually updated.

resources_en.properties

error.passwords.mismatch = Password did not match confirmed password
error.passwords.undefined = Password field is empty
error.new-password.denied = The new password does not confirm to password policy
```

Views

Password Reset UI flow depends on how the password method is configured - i.e. if the method allows users to reset a password themselves or alternatively have the system generate a password instead.
